

C2_00 Quick Revision - Astra RC4

Closed-book refresh before the Module Test

Use this after completing all eight SAF lessons and practice. Cover the right side and try to reconstruct each item aloud.

ID	Remember	Common trap	Pract
SAF1	Senior = decision safety, not tool complexity.	Starting charts before the decision/acceptance rule is known.	Decision + definition + grain/source + validation + risk + handoff.
SAF2	Turn vague asks into a bounded analysis contract.	Treating stakeholder wording as a complete specification.	A scoped question with audience, KPI, period, grain, deliverable and acceptance.
SAF3	Clarification is a controlled question tree with owners.	Leaving open questions in memory or chat only.	Question log: open item + owner/evidence + status/deadline.
SAF4	A KPI name is not a metric definition.	Comparing teams before numerator/denominator/time rules match.	Metric contract with formula, population, exclusions, grain, owner and version.
SAF5	State one-row meaning before joining or choosing source of truth.	Choosing the source with the most convenient number.	Grain statement + lineage map + explicit authority/conflict decision.
SAF6	Separate fact, assumption, risk and limitation.	Writing a recommendation stronger than the evidence permits.	Calibrated claim plus trigger that would change the conclusion.
SAF7	Validation is independent proof, not "the chart looks right."	Checking only the final number.	Counts/keys/control totals/segments/invariants reconciled with recovery.
SAF8	A professional analysis must survive handoff.	Saving only the final dashboard/file.	Definitions, source, refresh, validation, limitations, owner and next route.

60-second cumulative explain-back: A stakeholder asks for a dashboard urgently. Explain the senior-analyst sequence from ambiguous request to safe handoff without naming any software.

Ready for test when: you can reproduce the eight habits without the book and can state at least one failure/recovery path for each.
