

C2_00 Module Test - Protected Review RC4

Open only after a saved genuine attempt

Use each review to diagnose the missing reasoning, then close this file and solve the changed retry without copying.

1. SAF1 - what strong reasoning contains

A strong answer names the decision/audience, metric definition, row grain/source, validation control, unresolved risk/assumption, and handoff/acceptance rule before choosing stores. The important idea is not the exact wording; it is refusing to start with ranking logic while the decision contract is undefined.

Changed retry: Operations asks which warehouse needs intervention; define release controls before ranking.

2. SAF2 - what strong reasoning contains

A defensible scope states who will act, what decision is possible, what "unhappy" means, eligible customer population, period, row grain/source, segmentation, deliverable and acceptance. Open definitions remain explicit instead of being silently invented.

Changed retry: Scope "marketing is inefficient" for a decision about next-month channel budget.

3. SAF3 - what strong reasoning contains

Questions should separate definition, owner/evidence, time/population and decision threshold. Example: Who owns active-customer definition? What exact event makes a customer active? Which period/statuses are included? Which decision changes if the definition changes?

Changed retry: Product and Support disagree about "resolved ticket"; write the clarification tree.

4. SAF4 - what strong reasoning contains

The two denominators create different populations, so the percentages answer different questions. A metric contract should include name, purpose, numerator, denominator/population, exclusions, time basis, grain, source, owner, version and acceptance/reconciliation rule.

Changed retry: Contract "on-time delivery rate" when teams disagree about promised vs revised ETA.

5. SAF5 - what strong reasoning contains

Orders are order-line grain; target is Region-Month grain. Aggregate actuals to Region-Month (or preserve separate facts in a model) before comparing with targets. Never join target rows directly to order lines and then sum target value.

Changed retry: Compare customer-month health with ticket-level support data without grain leakage.

6. SAF6 - what strong reasoning contains

Fact must be directly observed; assumption is an unverified explanation; risk is what could make the decision wrong; limitation is what this evidence cannot establish. Recommendation should request/perform the next test rather than claim the price change caused churn.

Changed retry: Revenue rose after a campaign; write a non-causal recommendation and change trigger.

7. SAF7 - what strong reasoning contains

Check duplicate/business keys, row counts, period coverage, population/denominator, source control totals, segment reconciliation and invariants. Stop release, localize the first stage where reconciliation diverges, repair it, and rerun downstream checks.

Changed retry: A dashboard count differs from source by 11 rows; define the reconciliation path.

8. SAF8 - what strong reasoning contains

At minimum: decision/scope, definitions/metric contracts, source/grain/lineage, refresh steps, transformations/calculations, validation evidence, assumptions/limitations, known issues, owner/access, output location/version and next action.

Changed retry: Prepare an inheritable handoff for a monthly report owned by another team.

9. SYNTHESIS - what strong reasoning contains

Clarify decision -> contract metric/denominator -> state grain/source -> control duplicates -> compute only defensible metrics -> validate independently -> separate fact/assumption/limitation -> compare decision rules/sensitivity -> recommend with trigger -> handoff. An unresolved material denominator, grain, duplicate, validation or evidence-strength issue blocks release.

Changed retry: "Which product should we discontinue?" with duplicate product IDs and an undefined profitability denominator.
