

C2_00 Gate C Protected Review - Astra RC4

Subscription Billing - open only after the independent Gate C attempt is saved

Purpose: diagnose reasoning and repair a failed competency. This is not an answer sheet to copy into the Gate.

1. Objective fixture controls

These are invariant controls from the supplied workbook. They help you detect population/grain errors; they do not choose the business decision for you.

Plan	Events	Paid rate	Failure pattern
Basic	28	100.0%	0 failed / 0 cancelled / 7 retry
Pro	28	50.0%	14 failed / 0 cancelled / 7 retry
Team	28	50.0%	0 failed / 14 cancelled / 7 retry

2. Expected reasoning path

Decision contract

The stakeholder says renewal, but the extract is billing-event grain. First decide whether the decision concerns billing success, plan cancellation, or customer-level retention. Do not relabel event success as customer renewal.

Fixture diagnosis

After controlling one duplicate there are 84 unique billing events. Basic is 28/28 paid, Pro is 14 paid + 14 failed, and Team is 14 paid + 14 cancelled. Each plan also has seven retry-flagged events.

Grain and retries

A customer can have multiple events and retries, but customer identity is absent. Therefore customer-level renewal/retention cannot be calculated defensibly from this extract alone.

Prioritization

If the approved decision is payment-operations reliability, Pro has explicit failed billing events. If the decision is cancellation behavior, Team is the relevant pattern. The business question must select the meaning before a plan is ranked.

Validation

Reconcile paid events (56), failed events (14), paid amount (182,829.10), duplicate control and plan subtotals. Explain annual/monthly comparability and retry treatment.

3. Critical failure patterns

- Reporting a customer renewal rate from billing events without customer-level evidence.
- Double-counting retries as independent customers.
- Combining annual/monthly events without an approved comparison rule.
- Calling Pro or Team "worst" without stating whether the decision is payment failure or cancellation.
- Using paid amount as retention evidence without a metric contract.

4. Competency routing and repair proof

Competency	Pass evidence
Decision/scope	Defines whether the problem is payment success, cancellation or retention.
Metric contract	Event status/amount/retry/cycle rules explicit; customer-level limitation visible.
Grain/source	Billing-event grain protected; duplicate/retry behavior controlled.
Judgment	No customer-retention or causal claim beyond evidence.
Validation	Event/status/amount/plan totals reconcile and alternate definitions are tested.
Handoff/defense	Recommendation names required missing evidence and trigger for changing decision.

PASS PHILOSOPHY: No percentage gaming. One unresolved material definition, grain, duplicate, validation, or evidence-strength failure blocks the Gate even if other sections are polished.

5. Changed repair proof

Changed retry after repair: a SaaS billing extract includes multiple retries but no stable customer key. Decide what can be measured at event grain, what cannot be called retention, and what additional data is required before a customer-renewal recommendation.

NEXT ROUTE: Return to the named competency until changed evidence is stable; do not restart the entire course.
