

C2_00 Gate A Protected Review - Astra RC4

Food Delivery Operations - open only after the independent Gate A attempt is saved

Purpose: diagnose reasoning and repair a failed competency. This is not an answer sheet to copy into the Gate.

1. Objective fixture controls

These are invariant controls from the supplied workbook. They help you detect population/grain errors; they do not choose the business decision for you.

City	Orders	Cancel rate - all	Cancel rate - accepted
Bhubaneswar	18	66.7%	64.7%
Kolkata	18	0.0%	0.0%
Patna	18	66.7%	68.8%
Ranchi	18	0.0%	0.0%

2. Expected reasoning path

Decision contract

The stakeholder asks which city to fix first, but "first" could mean highest cancellation rate, highest actionable cancellations, highest value at risk, or another operational rule. State the decision rule before ranking.

Data quality and denominator

There is one exact duplicate row. After removing/controlling it, 72 unique orders remain. Using all placed orders produces a 66.7% cancellation tie between Bhubaneswar and Patna. Using accepted orders changes the rates to 64.7% and 68.8%, respectively.

Actionability sensitivity

Restaurant/driver cancellations are operationally different from customer cancellations. Bhubaneswar and Patna each have six actionable cancellations in this fixture, so a simple actionable-count rule still ties them. Do not invent a winner.

Recommendation boundary

A strong answer can recommend the next decision step (for example, confirm denominator/actionability and compare operational capacity) without pretending the data supports a unique city priority when the selected rule does not separate candidates.

Validation

Reconcile unique population, status counts, completed value (32,800.93 overall), segment totals and at least one independent control. Explain how the duplicate and denominator choice affect the result.

3. Critical failure patterns

- Ranking cities before defining denominator/decision rule.
- Leaving the duplicate uncontrolled or using DISTINCT without documenting why.
- Treating customer and restaurant/driver cancellations as equally actionable without owner agreement.
- Claiming cancellation caused delay or campaign performance.
- Choosing Patna/Bhubaneswar as an automatic winner when the selected metric ties.

4. Competency routing and repair proof

Competency	Pass evidence
Decision/scope	Decision, audience, weekend window and prioritization rule are explicit.
Metric contract	Numerator, denominator, exclusions/actionability, time basis and owner/source are explicit.
Grain/source	One row = order; duplicate controlled; source conflict documented.
Judgment	Fact vs assumption vs limitation separated; no causal overclaim.
Validation	Population/status/segment/control totals reconcile; sensitivity to denominator shown.
Handoff/defense	Another analyst can reproduce the decision and state what would change it.

PASS PHILOSOPHY: No percentage gaming. One unresolved material definition, grain, duplicate, validation, or evidence-strength failure blocks the Gate even if other sections are polished.

5. Changed repair proof

Changed retry after repair: a grocery-delivery manager asks which zone should receive driver incentives. Use a fresh dataset or instructor-assigned variant; define a new decision rule and show how alternate denominators could change priority.

NEXT ROUTE: Gate B only after targeted repair and explicit assignment.
