

C2_01 Quick Revision - Astra RC4

Closed-book refresh before the Module Test

Cover the answer columns and reconstruct the design rule, failure mode and proof for each AX lesson.

ID	Remember	Trap
AX1	Break formulas into named/auditable logic layers.	One giant formula nobody can debug.
AX2	Prove key/match behavior before choosing lookup syntax.	Lookup works but duplicates return the wrong business row.
AX3	Design dynamic arrays around spill behavior.	Copying formulas down instead of using one spill-safe result.
AX4	Translate KPI rules into explicit criteria gates.	Hard-coded criteria or mismatched date/status rules.
AX5	Pivot only after grain/fields are clean and reconcilable.	Trusting a Pivot total without source reconciliation.
AX6	Use a staged, named Power Query pipeline.	Random applied steps with no contract or recovery path.
AX7	Control folder scope and retain Source.Name.	Backup/temp/drift files silently entering or disappearing.
AX8	Append = stack; Merge = enrich by key.	Merge fan-out from non-unique dimension key.
AX9	Parameters change controlled inputs, not logic.	Editing M steps manually for each month/path.
AX10	Treat month-end reporting as a repeatable release process.	Calling refresh success a release without reconciliation.

Cumulative explain-back: Explain the safe monthly-refresh sequence from folder inventory to management release, including what makes you BLOCK rather than RELEASE.
