

C2_01 Module Test - Protected Review

RC4

Open only after a saved genuine attempt

Diagnose the missing reasoning, then close this file and solve the changed retry.

1. AX1 - strong reasoning

Separate inputs/cleanup, business-rule calculation and presentation. Use helper/named logic where it improves auditability. Check intermediate values on a tiny known case before trusting the final KPI.

Changed retry: audit a margin formula with separate discount/tax rules

2. AX2 - strong reasoning

The problem is key uniqueness/business identity, not lookup syntax. First detect duplicates, decide the authoritative row or aggregate rule, document it, and validate unmatched/multiple matches.

Changed retry: resolve duplicate product keys before a price lookup

3. AX3 - strong reasoning

Confirm the formula is dynamic, inspect the intended spill rectangle, remove/relocate blocking cells or table constraints, and verify the returned row set. Do not replace one spill formula with copied formulas as a workaround.

Changed retry: repair a UNIQUE/FILTER spill blocked by a table

4. AX4 - strong reasoning

Define value field, sum population, Region criterion, Status criterion, exact month/date boundaries, exclusions/blanks, and validation total before coding SUMIFS.

Changed retry: contract a COUNTIFS late-delivery KPI

5. AX5 - strong reasoning

Check source row grain/count, filters/slicers, date/status fields, blank/error handling, source range/table expansion and independent source total. Reconcile before changing layout.

Changed retry: reconcile a customer-status Pivot to raw records

6. AX6 - strong reasoning

Source -> scope/schema -> type -> clean/standardize -> business transformations -> validate/load. Each step has a stable purpose/name and the first broken contract is the repair point.

Changed retry: design a staged import for a different monthly extract

7. AX7 - strong reasoning

Whitelist expected monthly files or use an explicit naming/date contract, exclude backups/temp files, retain Source.Name, and make schema drift visible as a controlled failure instead of silently skipping the file.

Changed retry: control a folder containing temp and drift files

8. AX8 - strong reasoning

Append stacks compatible rows; merge adds attributes by key. State left/right grains and expected cardinality, then compare rows/distinct keys before/after and surface duplicates/unmatched keys.

Changed retry: choose append/merge for order lines plus customer attributes

9. AX9 - strong reasoning

A parameter centralizes an approved variable such as folder path/date cutoff. Query logic remains unchanged and can be tested for allowed values; manual edits create untracked configuration drift.

Changed retry: parameterize a date cutoff instead of editing M

10. AX10 - strong reasoning

Expected files present; no backup contribution; schema contract satisfied; key exceptions controlled; row/value totals reconcile; KPIs/Pivots reconcile; failures documented; owner/version/handoff recorded; only then RELEASE.

Changed retry: write a release checklist for a weekly workbook

11. SYNTHESIS - strong reasoning

BLOCK. Inventory expected files first, expose the missing/drift condition, test duplicate key before any merge, localize the 12% row increase, repair source/key logic, rerun row/value reconciliation and only then refresh summaries. A successful refresh is not evidence of correctness.

Changed retry: a folder refresh is green but an unmatched key and missing file remain
