

C2_01 Gate C Protected Review - Astra RC4

Field Service Parts - open only after saved independent attempt

Purpose: repair refresh/query reasoning, not copy a finished workbook.

1. Objective controls

Control	Expected	Observed/failure	Why it matters
Approved files	3 monthly files	3	Backup/drift are not normal inputs
Approved fact rows	90	90	Scope baseline
Completed rows	69	69	KPI population control
Completed gross	243800.13	243800.13	Must reconcile before/after enrichment
Dirty dimension key	T03	identical duplicate	Must detect before merge
Unmatched fact key	T97	visible exception	LEFT-style exception evidence
Backup rows	0	1 bogus row exists	Must be excluded by scope
Drift file	visible failure	renamed key column	Must not silently disappear

2. Expected reasoning path

Source inventory: build expected-vs-actual inventory before Folder.Combine. Approved monthly files enter; IGNORE_backup contributes zero rows; the DRIFT file must be explicitly detected/handled rather than silently skipped.

Key quality: T03 appears twice in the dirty dimension. The duplicate rows are identical, so deduplicating to one authoritative row is a defensible technical control here - but only after you prove they are identical and record the rule. The unmatched fact key T97 stays visible for investigation.

Merge safety: after dimension repair, fact rows must remain 90. A merge that increases rows proves fan-out. Preserve unmatched rows/exceptions rather than converting the problem into a smaller INNER JOIN result.

Reconciliation: completed rows = 69 and completed gross = 243800.13 before and after enrichment. Pivot/KPI totals must reconcile to the approved fact population.

Business decision: Technician-group investigation should use the approved operational KPI after refresh controls pass; the extract does not establish technician causality or part-family root cause by itself. Use group metrics only after the data contract is clean. A group rank does not excuse a failed source/key/schema control.

3. Group diagnostic after controlled dedupe

Group	Rows	Completed	Cancelled	Cancel rate
Metro	23	19	4	17.4%
Mixed	32	23	9	28.1%
Rural	34	27	7	20.6%
UNMATCHED	1	0	1	100.0%

4. Critical failures and repair proof

- Backup file contributes rows or is excluded only by manual deletion.
- Schema-drift file is silently skipped, so expected source coverage is incomplete.
- Duplicate dimension key reaches merge and multiplies fact rows.
- Unmatched fact key disappears without explicit exception handling.
- Completed gross/row controls change after enrichment without explanation.
- A green refresh or attractive Pivot is treated as proof of release readiness.

5. Competency floors

Competency	Proof
Formula/query logic	Auditable steps and business rule; no hidden manual patch.
File scope	Expected/actual inventory; backup excluded; drift visible.
Key/merge	Duplicate controlled before merge; unmatched visible; row count stable.
KPI/Pivot	Correct approved population and independent reconciliation.
Release/handoff	RELEASE only when critical controls pass; recovery and owner documented.

Changed repair proof: rerun the failed competency on a fresh folder/data variant. Do not use this review as the changed evidence. Gate C remains the final fresh reassessment for this module.
