

C2_02 Advanced SQL - Start Here RC4

Astra parity learner route. PostgreSQL execution is required on the learner machine; static package QA is not a substitute for runtime SQL evidence.

File to open

Step	File Location
1	01_TEACH/C2_02_ADVANCED_SQL_TEACHING_BOOK_ASTRARC4.pdf
2	Run 02_PRACTICE/C2_02_POSTGRESQL_LAB_SETUP_RC1.sql in disposable PostgreSQL.
3	For each lesson attempt matching P-ASQL task, validate, explain, then protected practice review + changed retry.
4	Mini-Lab 1 -> Mini-Lab 2 -> Quick Revision -> optional diagnostic Module Test.
5	Gate A. Gate B/C remain hidden fresh reassessments unless explicitly assigned.

Critical rule: never repair a bad SQL total by hiding rows. Preserve duplicates/orphans as evidence until the business/key contract tells you how to resolve them.

Native runtime boundary

This package can statically validate fixture bytes, expected controls, routes and rendered PDFs. It cannot claim live PostgreSQL query execution, EXPLAIN plans or learner-machine setup without a PostgreSQL runtime.
