

C2_02 Module Test - Astra RC4

Non-gating diagnostic. Save a genuine closed-book attempt before opening the protected review. This test cannot unlock or block Gate A.

1. ASQL1

An order table is one row/order and items are one row/order+line. What must you do before summing order-level revenue after a join?

2. ASQL2

When is a subquery result unsafe for a scalar comparison?

3. ASQL3

Why can named CTE stages improve validation even when the optimizer may inline them?

4. ASQL4

Explain how a window aggregate differs from GROUP BY at row grain.

5. ASQL5

RANK and ROW_NUMBER disagree on tied values. What business rule must be stated?

6. ASQL6

Why can LAG give a misleading month-over-month comparison when a month is missing?

7. ASQL7

Write the denominator contract for a completion-rate KPI before SQL syntax.

8. ASQL8

Why is `>= start AND < next_start` safer than `<= 23:59:59`?

9. ASQL9

Name four exception queries you would run before trusting a joined KPI.

10. ASQL10

A total changes after a join. What is the first debugging evidence you compare?

11. ASQL11

What does EXPLAIN tell you that a fast runtime alone does not?

12. ASQL12

What evidence makes analytical SQL maintainable for another analyst?

Submission

Save answers plus one runnable validation query for any two questions. Score diagnoses repair targets only; Gate A remains governed by lesson mastery + both Mini-Labs.
