

C2_03 Professional Power BI Modeling - Start Here RC4

Astra parity learner route. Power BI Desktop is required for live relationship/filter evidence; static package QA never substitutes for learner-PC model behavior.

Step	File / action
1	Open 01_TEACH/C2_03_PROFESSIONAL_POWERBI_MODELING_TEACHING_BOOK_ASTRARC4.pdf.
2	Use the supplied practice data + evidence workbook lesson-by-lesson. Keep raw/dirty evidence visible until the key/grain contract justifies a repair.
3	For every PBM-A lesson: guided build -> independent changed task -> validation -> explain-back -> saved evidence -> protected practice review -> changed retry.
4	Parcel semantic-model Mini-Lab -> Quick Revision -> optional diagnostic Module Test.
5	Gate A Retail Sales & Returns. Gate B Clinic and Gate C Logistics remain hidden fresh reassessments unless explicitly assigned after repair.

Critical rule

A model is not correct because Power BI accepts the relationships or a visual looks plausible. Declare fact grain, prove one-side key quality, test filter propagation, reconcile independent controls, and keep unknown/dirty keys visible until resolved.

Native runtime boundary

This package can statically validate data fixtures, routes, objective controls, source mappings and rendered PDFs. It cannot certify Power BI Desktop relationship behavior, Performance Analyzer timings, refresh behavior or learner-machine UI without live execution.
