

C2_03 Module Test - Protected Review RC4

Open only after a saved genuine attempt. Diagnose the weak competency, then close this review and perform a changed retry.

PBM-A1

Business process/decision, every fact grain, intended dimensions/filter questions, relationship/date-role assumptions, and independent validation controls. The contract should let a reviewer predict the model before seeing the PBIX.

PBM-A2

The one side of a one-to-many relationship must identify an entity uniquely. Duplicate keys create ambiguous attribute/filter meaning and can force invalid cardinality or duplicate propagation. Investigate cause before choosing a documented repair.

PBM-A3

A star gives filters a clear dimension-to-fact route at declared grains. Fact-to-fact links often mix grains, create ambiguous filter paths, and make additive measures easy to double count.

PBM-A4

Check both fact grains, relationship existence/active state/cardinality/direction, key coverage/orphans, and a tiny known filter case. Do not enable Both merely because one visual did not respond.

PBM-A5

Legitimate when the business relationship itself is many-to-many or when a bridge/higher-grain pattern is required. It is not legitimate as a shortcut around a duplicate key that should have been unique.

PBM-A6

The report question and expected default slicer behavior choose the role. If most measures mean Order Date, make that default/active; expose Ship Date through a deliberate alternate relationship/role or duplicated role-playing dimension as designed.

PBM-A7

Unique date key, continuous range covering facts, correct data type/attributes, and tested relationships to each fact role. Also reconcile boundary dates and avoid hidden auto-date behavior becoming the undocumented authority.

PBM-A8

Staging establishes source scope/types/basic cleaning while keeping lineage; downstream/model-ready queries apply reusable business transforms and load only what the model needs. Record row/key controls across the dependency chain.

PBM-A9

At minimum: source/fact row counts, one-side uniqueness, unmatched keys, relationship/filter propagation tests, date-role tests, material measure/total reconciliation, and documented exceptions/release decision.

PBM-A10

Otherwise an optimization can silently change the business result. Capture a correct baseline, inspect model/cardinality/relationship/analyzer evidence, change one thing, rerun the same controls, and retain it only with result parity.

Repair routing

Weak evidence	Repair route
contract / grain / star	PBM-A1-A3 + changed model sketch and key register
relationships / M:M / roles / dates	PBM-A4-A7 + fresh filter/date-role model
Power Query / QA / performance	PBM-A8-A10 + changed lineage/reconciliation/performance case

Close this review and prove the weak skill on a changed scenario. The diagnostic remains non-gating; Gate A eligibility is unchanged.
