

C2_04 Advanced DAX & Reporting - Start Here RC4

Astra parity learner route. Power BI Desktop is required for DAX/report/RLS execution; Power BI Service is optional until lifecycle practice and depends on account/licensing conditions.

Step	File / action
1	Open 01_TEACH/C2_04_ADVANCED_DAX_REPORTING_TEACHING_BOOK_ASTRARC4.pdf.
2	For DAX1-DAX10: build the base measure, predict context, test detail/subtotal/total and changed slicers, validate, explain, then protected practice review + changed retry.
3	For DAX11-DAX15: save decision/story, interaction, accessibility, identity-security and lifecycle evidence rather than screenshots with no test.
4	Executive BI Mini-Lab -> Quick Revision -> optional non-gating Module Test.
5	Gate A SaaS Revenue & Customer Success. Gate B Support and Gate C Healthcare remain hidden fresh reassessments unless explicitly assigned after repair.

Critical rule

A plausible number is not proof. Define the business measure and context, then verify detail, subtotal/grand-total, period boundaries, semi-additive snapshot behavior, interaction/accessibility and RLS identities. Never “fix” totals by hardcoding visual-specific logic.

Runtime boundary

Static QA can validate fixtures, formulas described by the course, routes, source mappings and rendered documents. It cannot certify live DAX results, RLS identity behavior, Service sharing/refresh or tenant/licensing behavior without native execution.
