

C2_04 Gate B Protected Review - Astra RC4

Support Operations. Fresh remediation reassessment only; open after a saved Gate B attempt.

1. Objective controls

Control	Expected	Why it matters
Ticket population	120 tickets 80 Resolved 40 Open	Resolved-rate denominator is 120 only if the business contract includes open tickets.
Priority	40 P1 40 P2 40 P3	Simple independent distribution control.
Date roles	Created Mar/Apr/May/Jun = 32/30/30/28; Closed resolved = 18/20/20/20 + 2 in Jul	Created vs Closed period metrics answer different operational questions.
Resolution hours	Resolved average 34.5 hours	The fixture also gives 34.5 across all tickets by coincidence; matching output is not proof of a correct status filter.
Targets	28 Team-Month rows total 2,744	Seven teams x four months; target grain must not repeat under ticket rows.
Backlog snapshots	28 rows all-row sum 1,086 latest 2026-06-28 total 263	Backlog is semi-additive across snapshot dates; current backlog is not 1,086.
RLS mapping	ops.manager@example.com -> T01 + T03	Expected union: 34 tickets, 22 resolved across those teams.

2. Expected reasoning path

Ticket measures must distinguish CreatedDate from ClosedDate. Two resolved tickets close in July even though the target period stops in June, so a created-period and closed-period chart can legitimately disagree.

The average ResolutionHours is 34.5 for resolved tickets; it also happens to be 34.5 across all 120 rows in this synthetic fixture. That equality is a trap: prove the Status filter in the DAX/context rather than treating a matching number as validation.

BacklogSnapshot is one Team-SnapshotDate. Summing all four monthly snapshots produces 1,086, but the latest total is 263. A current-backlog KPI must select the intended latest snapshot in context.

Target is one Team-Month. Compare period resolved counts to targets through Team/Date dimensions; never multiply the target by ticket count.

ops.manager@example.com maps to T01 and T03. RLS should expose the union (34 tickets / 22 resolved in this fixture), while still denying other teams.

3. Critical failures

- Uses CreatedDate and ClosedDate interchangeably for operational trend.
- Accepts the accidental 34.5 average as proof that the resolved filter is correct.
- Sums backlog snapshots across months for current backlog.
- Repeats Team-Month target at ticket grain.
- Uses a grand-total special case instead of a measure that behaves consistently under filters.
- RLS multi-team user shows only one mapping or all teams.
- Accessibility/interaction/lifecycle tests are absent.

4. Competency floors

Competency	Required proof
DAX context / totals	Detail, subtotal/grand-total and changed-filter behavior match the written measure contract.
Time / semi-additivity	Period boundaries and snapshots/targets use correct grain; current/latest vs cumulative behavior is explicit.
Report / interactions	Decision hierarchy plus drill/tooltip/bookmark state tests; no essential conclusion is hover-only.
Accessibility / RLS	Meaning survives non-color/keyboard use; each relevant identity (including multi-mapped and denied cases) is tested.
Lifecycle / release	Owner, distribution, refresh/change/security evidence and RELEASE/BLOCK decision are explicit.

Changed repair proof

This protected review opens only after a saved genuine Gate B attempt. Close the review, complete a changed fresh retry on new team/date/snapshot/identity evidence, and save the retry evidence. Gate C remains a different healthcare full reassessment and opens only when explicitly assigned after repair.
