

C2_04 Gate C Protected Review - Astra RC4

Healthcare Network Performance. Final fresh reassessment; open only after a saved genuine Gate C attempt.

1. Objective controls

Control	Expected	Why it matters
Encounter population	100 encounters 67 Completed 33 Cancelled	Completion-rate and billing populations must be explicit.
Billing linkage	67 billing rows 67 unique encounters all completed encounters billed	A clean link does not make BillAmount equal BaseCharge.
Money controls	All BaseCharge 133,448.85 Completed BaseCharge 87,094.99 Billing 95,804.53	Different measures/populations; do not force equality.
Date roles	Visit rows Feb-Mar-Apr-May-Jun = 25/21/20/20/14; Discharge = 23/21/22/18/16	Visit and discharge period measures shift counts.
Billing periods	15/14/13/14/11 rows Feb-Jun	BillingDate is a third operational date role.
Targets	15 Specialty-Month rows total 1,665	Three specialties x five months at higher grain.
RLS mapping	multi.director@example.com -> North + Central	Expected union has 71 encounters, including 48 Completed.

2. Expected reasoning path

Encounter, Billing and Specialty-Month Target are separate grains. In this fixture every completed encounter has one billing row and no cancelled encounter is billed, but the monetary values still differ by business definition.

All encounter BaseCharge is 133,448.85; completed-only BaseCharge is 87,094.99; Billing totals 95,804.53. A professional report labels and reconciles each measure rather than “fixing” one to equal another.

VisitDate, DischargeDate and BillingDate produce different monthly populations. State which date answers each KPI and test the boundary movement before using time intelligence.

Target is Specialty-Month. It can be compared to encounter counts through conformed Specialty/Date filters but must not be repeated down encounter/billing rows.

multi.director@example.com maps to North and Central. The expected security union contains 71 encounters, 48 completed; East must remain excluded.

3. Critical failures

- Counts Billing rows as all encounters or uses BillAmount as BaseCharge without definition.
- Uses one date relationship for visit, discharge and billing questions.
- Repeats Specialty-Month target under encounter/billing detail.
- Computes completion rate with a drifting denominator under slicers.
- Critical healthcare exception is communicated only through color/hover.
- RLS is not tested for the multi-area user and denied area.
- Release lacks refresh/access/change owner.

4. Competency floors

Competency	Required proof
DAX context / totals	Detail, subtotal/grand-total and changed-filter behavior match the written measure contract.
Time / semi-additivity	Period boundaries and snapshots/targets use correct grain; current/latest vs cumulative behavior is explicit.
Report / interactions	Decision hierarchy plus drill/tooltip/bookmark state tests; no essential conclusion is hover-only.
Accessibility / RLS	Meaning survives non-color/keyboard use; each relevant identity (including multi-mapped and denied cases) is tested.
Lifecycle / release	Owner, distribution, refresh/change/security evidence and RELEASE/BLOCK decision are explicit.

Changed repair proof

This protected review opens only after a saved genuine Gate C attempt. Close the review and complete a changed fresh retry on new healthcare evidence for the named weak competency. Save the retry evidence. If instability remains after Gate C, return only to that named competency; do not recycle Gate A/B/C answers as proof.
