

C2_05 Python Automation for Analysts - Start Here RC4

Astra-parity route. The notebooks/scripts are learner workspaces; the teaching book stays self-sufficient even when external videos are unavailable.

Step	Action
1	Read the matching PYA lesson, follow the demonstration once, then save your own genuine attempt.
2	Use 02_PRACTICE/C2_05_PRACTICE_NOTEBOOK_RC1.ipynb with the supplied practice data; keep raw inputs unchanged.
3	Validate file scope, schema/types, key uniqueness/cardinality, unmatched rows, row/amount reconciliation, logs and release gating.
4	Weekly Reporting Pipeline Mini-Lab -> Quick Revision -> optional non-gating Module Test.
5	Gate A Retail Orders. Gate B Support Tickets and Gate C Subscription Billing are fresh remediation reassessments only when explicitly assigned.

Protected-review rule

Save a genuine attempt first. Open only the relevant protected review, understand the failed control, close it, then solve a changed fresh retry and keep the new evidence separately.

Runtime boundary

Static QA validates notebook structure/syntax, datasets, controls, links, routes and rendered documents. OS paths, installed package versions, network/API availability and learner-machine execution remain native-runtime evidence.
