

C2_05 Quick Revision - Astra RC4

Use after study; this is not a replacement for the learner book.

Lesson	Recall	Professional check
PYA1	Script entry point	Explicit inputs/config + main() + clean-process rerun
PYA2	Functions	One responsibility + explicit parameters/returns + small deterministic tests
PYA3	pandas contract	Required schema/types + explicit transformations + independent reconciliation
PYA4	Multi-file	Expected file scope + deterministic discovery + lineage + per-file controls
PYA5	Excel output	Write fresh output, reopen, reconcile; raw/template stays unchanged
PYA6	CSV/JSON	Declare output grain before normalization; reconcile parent/item counts
PYA7	API	timeout + raise_for_status + payload/schema validation + bounded exceptions
PYA8	Errors	Catch specific recoverable errors; preserve context; block unsafe continuation
PYA9	Logs/validation	Useful logs + machine-readable PASS/FAIL controls
PYA10	Recurring report	Orchestrate in order; publish only on PASS; unchanged rerun is safe
PYA11	Reproducibility	Environment/config/input/version/check/output manifest

Release checklist

Before any automation output is considered deliverable: expected files are explicit; malformed/unexpected files have a stated decision; master keys are unique before merge; unmatched keys remain visible; row and important-value controls reconcile; errors are not swallowed; validation is machine-readable; critical FAIL withholds output; unchanged rerun does not duplicate business results; a run manifest captures environment, inputs and outputs.

Mastery

You are ready for the module assessment when you can explain why a pipeline can produce a plausible report and still be unsafe, then show the controls that would catch that failure.
