

C2_05 Gate B Protected Review - Astra RC4

Support Tickets. Fresh remediation reassessment only; open after a saved genuine Gate B attempt.

1. Objective fixture controls

Control	Expected	Why it matters
Approved scope	2 approved ticket files; 100 rows	Malformed August file is not an approved production input.
Master key	9 team rows / 8 unique; duplicate T03	Duplicate master key must block merge.
Unmatched key	T99 on 1 ticket; 52 resolution-hours value	Exception remains visible instead of disappearing.
Resolution-hour control	3,450 total; mean 34.5	Use only as numeric fixture controls, not a business SLA definition.
Duplicate fan-out	T03 appears on 13 tickets; naive merge -> 113 rows / 3,839 resolution-hour total	Inflation 389 demonstrates cardinality failure.
Status split	50 Open / 50 Resolved	Status is categorical scope evidence; do not infer that resolution_hours should be blank solely from label.
Created month rows	Jun 44 / Jul 32 / Aug 24	Actual dates cross filename boundaries; validate content rather than trust filenames.

2. Expected reasoning path

Discover only expected approved files and make the malformed-file decision explicit.

Validate T03 uniqueness before enrichment; do not “fix” it by keep-first without source-owner rule.

Use merge validation/indicator and preserve T99.

Reconcile 100 rows and 3,450 numeric control; naive duplicate-key merge would create 113 rows and 3,839.

Structured validation should record observed vs expected and block publication on critical key/file/schema failures.

Run again unchanged and prove deterministic output plus manifest/log evidence.

3. Critical failures

- Malformed file enters because glob pattern is too broad.
- Duplicate T03 creates 13 extra enriched rows.
- T99 disappears.
- Blanket exception catches failure and writes stale/partial output.
- Validation is only printed prose with no machine-readable result.
- Rerun appends another copy.

4. Competency floors

Competency	Required proof
Clean start / modularity	Explicit config/entry point; functions have coherent responsibilities and can be tested independently.
File/schema/key controls	Approved file scope, schema/types, master uniqueness, merge cardinality and unmatched evidence are explicit.
Reconciliation / release gate	Rows and key numeric controls reconcile; critical FAIL withholds final output.
Errors / observability	Specific failures carry context; logs + structured validation show stage and observed value.
Rerun / reproducibility	Unchanged rerun does not duplicate business results; run manifest records environment, inputs and outputs.

Changed repair proof

This protected review opens only after a saved genuine Gate B attempt. Close it, complete a changed fresh retry on new support files/teams and save retry evidence. Gate C remains a different Subscription Billing reassessment and opens only when explicitly assigned after repair.
