

C2_06 Quick Revision - Astra RC4

Recall after study; use the learner book for first learning.

Lesson	Recall	Professional check
DWF1	Operational vs analytical	Protect operational workflow; design analytics for history/integration/scan
DWF2	OLTP vs OLAP	Small concurrent writes vs broad historical scans/aggregations
DWF3	Warehouse	Integrated durable analytical history with governed structures
DWF4	Facts/dimensions	One fact row = declared process grain; conformed dimensions describe it
DWF5	Keys	Business key identifies source entity; surrogate key identifies warehouse row/version
DWF6	SCD	Type 1 overwrite vs Type 2 version with non-overlapping effective intervals
DWF7	ETL/ELT	Choose transform location from platform, governance, replay and scale
DWF8	Layers	Staging/replay -> governed transform -> business presentation
DWF9	Lake/lakehouse	Object flexibility vs warehouse relational analytics vs table semantics on lake
DWF10	Batch/stream	Freshness requirement vs state/order/cost/operational complexity
DWF11	Lineage/metadata	Source-to-KPI path + owner/grain/schema/business-rule context
DWF12	Quality	Checks have observed value, severity, owner/action; blockers stop promotion

Warehouse design checksum

Before defending a design, be able to state: business process; fact grain; conformed dimensions; business vs surrogate keys; unknown-member rule; history requirement/effective dating; separate target/process facts; ETL/ELT/layer replay logic; store and latency choice; lineage to the consumer KPI; and quality controls that block release.
