

C2_06 Gate B Protected Review - Astra RC4

E-commerce Returns. Fresh reassessment; open only after a saved genuine Gate B attempt.

1. Objective fixture controls

Control	Expected	Why it matters
Processes	110 orders / 15 returns	Order and return are different facts; return date is a separate event date.
Money controls	Order sales 158,337.64; return amount 8,318.27	Do not confuse return amount with order sales or repeat it across order detail.
Return FK	15 unique return order IDs; 0 orphans	Link can pass while seller history/target grain still fails.
Unknown seller	S99 on 1 order; sales 1,770.47	Unresolved dimension key must remain visible.
History	S05 Silver -> Gold effective 2026-06-01	Historical tier attribution follows order/event date.
S05 evidence	6 orders before / 8 after; sales 5,366.45 / 14,206.17	Current seller tier alone would misclassify earlier orders.
Target	9 unique Tier-Month rows; Gold .08, Silver .09, Bronze .10	Return-rate target is tier-month grain, not order grain.
Date roles	Orders May/Jun/Jul 46/40/24; returns 4/7/4	Order and return period questions require deliberate date roles.

2. Expected reasoning path

Keep Order and Return facts separate and relate through order/customer/seller dimensions as required.

Use SCD2 for seller tier if historical tier reporting is required; assign facts by effective interval.

Keep Tier-Month return targets independent and compare at compatible grain.

Surface S99 rather than silently dropping the order.

Lineage and quality evidence must show source counts, return link integrity, target grain and history handling.

3. Critical failures

- Return fields are flattened into order grain without declaring multiplicity.
- Current Gold tier is applied to S05 pre-June orders.
- Tier-Month target repeats per order.
- S99 disappears.
- Return-date and order-date trends are treated as interchangeable.
- Blocking history/FK issue is left unresolved at release.

4. Competency floors

Competency	Required proof
Process / grain	Facts, dimensions and targets represent declared processes/grains; no fan-out or repeated target.
Keys / SCD history	Business/surrogate keys, unknown-member handling and non-overlapping historical intervals are correct.
Layer / store / latency	ETL/ELT, replay layers, platform and batch/stream choice follow requirements and recovery needs.
Lineage / metadata	Source-to-KPI path, owner/grain/schema/rule metadata are sufficient to explain the output.
Quality / release	Reconciliations and integrity checks have severity/owner/action; blocking failure stops publication.

Changed repair proof

This protected review opens only after a saved genuine Gate B attempt. Close it, complete a changed fresh retry on new seller/history/return-target evidence, and save it. Gate C remains a different Clinic reassessment and opens only when explicitly assigned after repair.
