

C2_07 Cloud / Fabric / Enterprise BI - Start Here RC4

Astra-parity route. Internal reasoning is authoritative for assessment; Microsoft Learn is the current implementation/reference companion.

Step	Action
1	Read the assigned CLD lesson. Draw the architecture/security/operations path in your own words before opening the practice workbook.
2	Use the practice workbook to decide workspace boundaries, build-vs-consume access, source connectivity, gateway need, freshness expectation, release controls and incident ownership.
3	Rebuild the decision on a changed scenario. Validate least privilege, source freshness, release gates and business impact - not just product terminology.
4	Complete the Northstar enterprise deployment Mini-Lab, then Quick Revision and the optional non-gating Module Test.
5	Gate A Fleet is normal. Gate B Education and Gate C Energy are fresh reassessments only when explicitly assigned after repair.

Protection rule

Save a genuine attempt before protected material. Open the review only after the attempt exists, close it, complete a changed fresh retry, and save the retry as separate evidence.

Operational truth rule

A successful refresh/deployment/pipeline status is one signal. It does not prove source completeness, correct security scope, intended freshness, correct audience, or business acceptance. Validate the business control separately.

Runtime boundary

Static QA validates course fixtures, reasoning, source mapping, routes and rendered documents. Native Fabric/Power BI Service tenant behavior, licenses, capacity, gateways, identities and deployment features remain environment-dependent learner evidence.
