

C2_07 Quick Revision - RC4

Use after study. This is retrieval support, not a substitute for the learner book or a Gate attempt.

Lesson	Memory anchor	Can you defend this?
CLD1	Cloud fundamentals	Tenant -> workspace -> capacity -> item; managed service does not remove ownership/security/cost responsibility
CLD2	Compute / storage / identity	Compute performs work, storage persists data, identity/permission authorizes action
CLD3	Fabric ecosystem	Choose only needed workloads around OneLake; map workload to responsibility
CLD4	OneLake / lakehouse / warehouse	Shared logical storage; shortcuts reduce copies; lakehouse vs warehouse serve different patterns
CLD5	Enterprise Power BI Service	Builder workspace -> semantic model -> report -> app/share -> consumer; include ownership/refresh/support
CLD6	Deployment	DEV -> TEST -> PROD; failed validation blocks promotion; avoid direct PROD editing
CLD7	Refresh / gateway	Cloud -> identity/credentials -> gateway if on-prem -> source -> refresh -> freshness SLA
CLD8	Permissions / governance	Broad workspace role + narrower item/app/data controls; least privilege, groups, lineage, sensitivity
CLD9	Monitoring	Symptom -> dependency -> impact -> owner -> recovery -> downstream validation
CLD10	Collaboration	Business/KPI contract -> semantic/transform contract -> source/pipeline contract; acceptance evidence joins teams

Five controls to say aloud

1) Name the environment and source dependency. 2) Name the identity and minimum permission. 3) State whether a gateway is required. 4) State the freshness/release acceptance rule. 5) State what incident would block promotion or require consumer warning.

Move on only when

You can design a fresh workspace/source/security/release/monitoring route without copying the book and explain why each control exists.
