

C2_07 Practical Mastery Check - RC4

Closed-book, non-gating diagnostic. Save your first attempt before opening the protected review.

Task	Fresh transfer prompt
1	A source is in an on-premises SQL Server. Draw the minimum refresh dependency chain and identify the component that differs from a cloud SaaS source.
2	A contractor needs one certified report for two weeks. Explain why workspace Contributor is a poor default and propose the smallest useful access pattern.
3	A TEST -> PROD deployment includes one passed visual change and one failed security rule. Decide whether promotion proceeds and state the evidence needed before retry.
4	A refresh job is green but today's telemetry partition is late. What can and cannot be concluded from the green status?
5	Separate the responsibilities of analyst, analytics engineer and data engineer for a KPI whose source arrives late and whose semantic definition has changed.
6	A report uses a cloud API, an on-prem source and a SharePoint target file. State gateway needs and why one freshness time cannot be assumed for all sources.
7	Describe DEV / TEST / PROD workspace separation and one reason direct editing in PROD weakens control.
8	An operations app suddenly shows all regions to regional managers. Give the first three evidence checks and name the severity/release implication.
9	Explain the difference between workspace role, item/app access and data-level restriction such as RLS.
10	Build a short incident record: symptom, likely dependency, business impact, owner, recovery, downstream validation and prevention.

Evidence

Save the diagram/decision table or written answer, assumptions, validation checks and any uncertainty. This test does not unlock or block Gate A.
