

C2_08 Gate B - Protected Review RC4

Inventory Replenishment. Fresh remediation reassessment only when assigned after Gate A repair; review opens only after saved Gate B attempt.

Page 1 - Evidence and decision boundary

Area	Evidence / control
Domain	Inventory Replenishment
Non-negotiable	Finance: extra inventory working-capital increase cannot exceed 12%
Capacity/constraint	Procurement MOQ and lead-time constraints
Observed evidence	SKU1: stockout 12%; 18 days inventory; lead 6; MOQ 500; monthly revenue 120,000 SKU2: 4%; 45 days; lead 3; MOQ 300; revenue 70,000 SKU3: 21%; 12 days; lead 15; MOQ 800; revenue 180,000 SKU4: 9%; 30 days; lead 7; MOQ 400; revenue 90,000 SKU5: 16%; 16 days; lead 10; MOQ 600; revenue 150,000
Material limitations	Forecast MAPE rose during festival weeks (High) SKU3 lead time based on only 4 recent orders (Medium) No exact lost-sales estimate for stockouts (High)

Required output

A management recommendation that separates observation, inference and recommendation; shows stakeholder trade-offs; states uncertainty; gives action/owner/measure/review; and identifies missing evidence/owners rather than inventing facts.

Page 2 - Expected reasoning and diagnostic traps

Expected reasoning
SKU3 has the highest stockout rate and revenue, low days inventory, longest observed lead time and highest MOQ; it deserves urgent analysis, but exact order quantity cannot be derived from these fields alone.
SKU5 is another high stockout/high revenue candidate; SKU1 follows. SKU2 has low stockout and high days inventory, so adding stock there needs strong justification.
The 12% working-capital cap cannot be numerically tested without unit cost/current inventory value/baseline working-capital information. Make that an explicit Finance-owned input instead of guessing.
Festival MAPE deterioration weakens point forecasts; use scenarios/guardrails and define an update point rather than stating a single certain demand number.
SKU3 lead-time evidence is thin (4 orders), so procurement confirmation or sensitivity is appropriate.
No exact lost-sales estimate means monthly revenue is not a proven amount of revenue saved by avoiding stockouts. Do not state causal/lost-sales impact as fact.

Critical traps

Trap	Why it blocks
Single-metric ranking	It can hide explicit finance/risk/policy constraints and answer the wrong decision.
Causal language from observational evidence	Association/risk score/operational pattern does not establish intervention effect.
Silent stakeholder compromise	The analyst is not authorized to erase a non-negotiable; expose options and decision owner.
Fake precision	Missing cost, calibration, population or causal evidence must remain uncertainty/open question.
No owner/review rule	A recommendation without accountable action and evidence review is not an executable management decision.

Page 3 - Repair and changed fresh retry

Use this protected review only after a saved genuine Gate attempt. Close it before reassessment.

Step	Required evidence
1. Diagnose	Name the failed competency: discovery, O/I/R, prioritization, uncertainty, conflict, recommendation, defense or handoff.
2. Repair	Correct only the weak reasoning; state why the original wording/decision was unsafe or unsupported.
3. Close review	Do not keep this worked review open during the reassessment.
4. Changed fresh retry	Solve a new management case with different evidence, stakeholder conflict and material limitation. B/C must remain fresh.
5. Save evidence	Save the new O/I/R, options/trade-off, executive summary, recommendation, uncertainty, defense and owner/handoff as a separate attempt.

Pass standard

The learner can defend the new recommendation without the review open, identify what is fact versus interpretation, state what would change the decision, and avoid claiming causal or financial precision that the case does not support.
