

C2_08 Gate C - Protected Review RC4

Customer Success Renewals. Final fresh remediation reassessment only when assigned; review opens only after saved Gate C attempt.

Page 1 - Evidence and decision boundary

Area	Evidence / control
Domain	Customer Success Renewals
Non-negotiable	Finance discount budget max 4% ARR + Product forbids unapproved feature-date promises
Capacity/constraint	CS team can run 10 interventions/week
Observed evidence	Acct1: ARR 250,000; risk .78; tickets 14; NPS 3; current discount 4% Acct2: 180,000; .62; 8; NPS 7; 3% Acct3: 420,000; .71; 22; NPS 4; 8% Acct4: 95,000; .35; 5; NPS 8; 2% Acct5: 310,000; .68; 19; NPS 5; 6%
Material limitations	Risk score not recalibrated since product launch (High) NPS missing for 22% of accounts (Medium) Discount impact on renewal is observational, not causal (High)

Required output

A management recommendation that separates observation, inference and recommendation; shows stakeholder trade-offs; states uncertainty; gives action/owner/measure/review; and identifies missing evidence/owners rather than inventing facts.

Page 2 - Expected reasoning and diagnostic traps

Expected reasoning
A risk-by-ARR lens makes Acct3, Acct5 and Acct1 reasonable first review candidates, but the stale risk model is a High limitation; do not present the risk scores as calibrated probabilities.
Acct3 has the largest ARR and many tickets but already shows 8% current discount; Acct5 shows 6%. Clarify what the 4% budget means (portfolio, incremental or per-account) before proposing any discount action.
Acct1 has the highest listed risk score and low NPS. A service/product investigation is defensible; a discount or feature promise is not automatically justified.
Product dates cannot be promised without Product approval. Separate product-gap diagnosis from roadmap commitment.
The observational discount relationship does not establish that discounts cause renewal. Treat discount as a governed option with measurement, not a guaranteed retention lever.
The sample has five accounts while intervention capacity is 10/week; do not manufacture a capacity conflict. Ask whether this is the full eligible population.
NPS completeness limitation concerns the wider population even though these five rows contain values; do not infer full-population completeness from this sample.

Critical traps

Trap	Why it blocks
Single-metric ranking	It can hide explicit finance/risk/policy constraints and answer the wrong decision.
Causal language from observational evidence	Association/risk score/operational pattern does not establish intervention effect.
Silent stakeholder compromise	The analyst is not authorized to erase a non-negotiable; expose options and decision owner.
Fake precision	Missing cost, calibration, population or causal evidence must remain uncertainty/open question.
No owner/review rule	A recommendation without accountable action and evidence review is not an executable management decision.

Page 3 - Repair and changed fresh retry

Use this protected review only after a saved genuine Gate attempt. Close it before reassessment.

Step	Required evidence
1. Diagnose	Name the failed competency: discovery, O/I/R, prioritization, uncertainty, conflict, recommendation, defense or handoff.
2. Repair	Correct only the weak reasoning; state why the original wording/decision was unsafe or unsupported.
3. Close review	Do not keep this worked review open during the reassessment.
4. Changed fresh retry	Solve a new management case with different evidence, stakeholder conflict and material limitation. B/C must remain fresh.
5. Save evidence	Save the new O/I/R, options/trade-off, executive summary, recommendation, uncertainty, defense and owner/handoff as a separate attempt.

Pass standard

The learner can defend the new recommendation without the review open, identify what is fact versus interpretation, state what would change the decision, and avoid claiming causal or financial precision that the case does not support.
