

C2_09 Core Practical Mastery Check - Protected Review RC4

Open only after a saved genuine attempt; diagnose, close, then solve a changed retry.

Task	Expected reasoning pattern
1	Decision first; define population/time/KPIs/grains, decision owner, constraints, open questions and observable acceptance.
2	Every source gets purpose, grain, keys, freshness, owner, quality/privacy risk and acquire/skip reason.
3	State output grain first; prevent multiplication; reconcile row/count/amount controls and test null/unmatched/duplicate keys.
4	Choose the tool that best supports governed ownership, rerun safety, observability, tests and handoff - not prestige.
5	Keep facts at their native process grains; dimensions label; role-playing dates are explicit; relationships have safe cardinality/filter direction.
6	Do not convert association into cause. Preserve alternatives and name evidence that would distinguish them.
7	Every visual earns its place by supporting a decision path; overview, drivers and exceptions must reconcile to the same governed definitions.
8	Use an independent control path; a repeated copy of the same transformation is not independent validation.
9	Headline, evidence, implication, action/owner, limitation and next evidence. No false precision or hidden definition conflict.
10	Purpose, source/grain, code/version, transformations/model, validation, runbook, failure/retry, known issues and ownership.
11	Defend trade-offs, not syntax trivia: why this choice, what alternative, what can fail, what metric/log proves health, what triggers redesign.
12	Use STAR/decision evidence without claiming team work as personal production; be ready for technical follow-up.
13	Promotion case needs repeated scope/impact/ownership and truthful gaps; title desire is not evidence.
14	Match role claims to proof. Label missing production/cloud/domain experience as gaps and choose apply/learn/skip honestly.

Changed retry

Close this review. Solve an equivalent integrated case in a different domain with new grains, one definition conflict, one data-quality failure and one material uncertainty. Save separately. The diagnostic remains non-gating.
