

C2_09 Final Gate A - Protected Review RC4

Subscription Services - open only after the complete saved genuine Gate attempt.

Protection

Do not use this as a pre-solve answer sheet. Compare it only after your own evidence is saved. Then close the review and complete the assigned changed fresh retry.

Page 1 - Objective controls and first broken dependency

- 90 invoices total 24,507.75. The 07:00 payment feed has 78 rows totaling 21,176.67; the late batch has 12 rows totaling 3,267.70. Final captured payments total 24,444.37.
- The late batch is 13.37% of final captured collections. A green 07:00 semantic-model refresh is therefore technically successful but business-incomplete.
- All 90 invoice IDs have one payment row and payment invoice IDs are unique. However, 11 invoices have a smaller payment than invoice amount; total invoice-minus-payment gap is 63.38. Do not force row equality without the partial-payment/business rule.
- Health is Customer-Month grain (60 rows). Collection targets are Month-Region grain (8 rows). Joining either at invoice grain without period/key discipline can multiply or misstate measures.
- Booked subscription value, invoice amount, collected cash, active subscription status and health score are separate business concepts; never silently collapse them into one "growth" metric.

Interpretation boundary

Exact controls test grain, completeness and rerun safety. They do not create a single automatic business recommendation; definitions, period, prioritization metric and uncertainty must be explicit.

Page 2 - Reasoning audit

Decision / definitions

Name who owns healthy-growth, collection and active-customer definitions. Present separate governed metrics or labeled scenarios when owners disagree.

SQL / grain

Declare each output grain. Aggregate payment to invoice before joining where needed; join customer health on customer + month; join targets only after a compatible Month-Region aggregation.

Model / DAX

Use dimensions for customer/region/date and facts at their native subscription/invoice/payment/health grains. Measures should state which date and definition they use.

Failure / rerun

First broken dependency is data completeness, not Power BI. Ingest/validate the late batch, rerun idempotently, reconcile row/count/amount controls, then republish with corrected freshness metadata.

Executive / privacy

Do not expose unnecessary customer-level details. State the 07:00 incompleteness and any invoice-payment gap/target-unit uncertainty before recommending region action.

Page 3 - Critical floors, repair and changed retry

- Fact fan-out or incompatible grain
- Publishing 07:00 collections as final after the 08:10 batch exists
- Silent choice among booked/invoiced/collected/active definitions
- No independent reconciliation of rows and amounts
- Target comparison without confirming period/unit contract
- Causal overclaim, unsafe rerun, privacy breach or inflated ownership

Repair rule	Repair only the weak competency with a targeted exercise. Do not reopen this review while solving the changed case.
Changed fresh retry	If Gate A is clean, it is terminal. If targeted repair is required, close this review and take the protected Gate B Healthcare Network Operations case only when explicitly assigned.
Evidence to save	First attempt, review diagnosis, targeted repair artifact, changed-retry submission, reconciliation/validation evidence, one failure/recovery note, privacy/security check and own-words defense.
