

C2-00 Mini-Lab - Metric Disagreement

Integrated practice after SAF1-SAF8; attempt before any review

SCENARIO

Marketing reports September Net Revenue = 9.84 million. Finance reports 9.41 million. The dashboard owner says, 'Fix the number before the meeting.' You discover Marketing recognizes returns when they are processed, while Finance recognizes approved returns against the original order period.

YOUR JOB

Do NOT choose the number first. Produce: decision need; scoped analysis brief; metric contract; source/grain/lineage comparison; clarification questions and owners; reconciliation plan; assumption/risk/limitation note; temporary communication wording; final handoff/change-log requirement.

PASS SIGNAL

You turn a number mismatch into a controlled business-definition decision. You do not hide uncertainty, you do not silently redefine revenue, and you do not recommend action until the material disagreement is reconciled or explicitly approved as a temporary assumption.

Mini-Lab - Follow with me once

Use the method, not these exact words

FIRST 10 MINUTES

1. State the decision: which revenue view is valid for the meeting and what action depends on it? 2. Write the two competing return-recognition rules. 3. Declare order-line grain and return-event grain. 4. Name Finance as the revenue-recognition owner unless your organization defines another owner. 5. Design reconciliation by month/order-line/return event.

DO NOT CALCULATE PAST THE CONTRACT

If the owner has not approved whether returns should be restated to the original order period, show both controlled views and their difference. Label them clearly. A senior analyst can deliver a decision-safe interim view without pretending the definition conflict is solved.

EVIDENCE

Save the workspace, one validation control, the decision log, and a 90-second defense answering: What is known? What is unresolved? Who owns the rule? What would change the final number? What can the meeting safely decide now?
