

Remediation 1 - Formula architecture

Use only for the weak competency; do not restart the whole module

WHEN TO USE

Long formulas, repeated hard-coded rules, or no independent control.

TARGETED REPAIR

Rebuild one shipping-cost model using visible assumptions, one Table, one output summary and two controls. Explain which cell changes when the rule changes.

PASS SIGNAL

Pass when business constants are discoverable and output can be independently reconciled.

Remediation 2 - Lookup / key integrity

Use only for the weak competency; do not restart the whole module

WHEN TO USE

XLOOKUP works but duplicate/unmatched keys were not investigated.

TARGETED REPAIR

Use a dirty account master. Produce blank-key count, duplicate-key list, exact lookup, unmatched list and source-row parity.

PASS SIGNAL

Pass when no-match and duplicate behavior is explicit and row count remains stable.

Remediation 3 - Dynamic/Pivot reporting

Use only for the weak competency; do not restart the whole module

WHEN TO USE

Spill/Pivot output looks correct but completeness/refresh was not proven.

TARGETED REPAIR

Create one dynamic exception view and one Pivot summary. Force a spill obstruction, add a new source row, refresh, and reconcile both outputs.

PASS SIGNAL

Pass when the learner can explain dynamic output range and stale-report risk.

Remediation 4 - Power Query ingestion

Use only for the weak competency; do not restart the whole module

WHEN TO USE

Folder/query steps run but source scope or drift is uncontrolled.

TARGETED REPAIR

Combine three files while excluding a backup, retain Source.Name, add a drift file, identify first failing step and show per-file contribution.

PASS SIGNAL

Pass when unexpected files/schema cannot silently enter or disappear.

Remediation 5 - Merge / release discipline

Use only for the weak competency; do not restart the whole module

WHEN TO USE

Merge multiplies facts or month-end report is published after an unresolved critical check.

TARGETED REPAIR

Repair a duplicate dimension key, run anti-join exceptions, reconcile totals, then execute BLOCK -> repair -> rerun -> RELEASE evidence.

PASS SIGNAL

Pass when critical source/key/grain/reconciliation failures stop publication.
