

C2-02 Gate C Protected Review

Subscription Billing / Payment Reliability - open only after saved independent attempt

OBJECTIVE FIXTURE CONTROLS

account raw rows=18 | account unique ids=17 | duplicate account id=8 | invoices rows=95 | paid invoices=57 | paid invoice amount=184743.17 | payments rows=83 | orphan account id=999 | orphan payment invoice id=9999

STRONG ATTEMPT

The query package states grains before joins, investigates duplicate/orphan conditions, uses typed time logic, builds KPI/window logic at the correct grain, validates with independent controls, and provides a readable business interpretation/handoff. A correct-looking final table is not enough.

CRITICAL FAILURES

Unexplained row multiplication/loss; denominator mismatch; missing time-boundary decision; event/fact grain mixed; orphan rows hidden; validation missing; EXPLAIN treated as proof of correctness; copied protected answer.

Gate C competency routing

Repair one weak area, then prove it on changed evidence

COMPETENCY FLOORS

1 Grain/cardinality. 2 Query architecture/subquery/CTE clarity. 3 Window/rank/time logic. 4 KPI/conditional aggregation. 5 Data-quality investigation. 6 Independent debugging/validation. 7 Performance awareness after correctness. 8 Production-style documentation/interpretation.

PASS PHILOSOPHY

No percentage gaming. Any unresolved critical grain, join, denominator, time or validation failure blocks pass even if other SQL is strong.

NEXT ROUTE

If critical instability remains, return to targeted remediation with a new diagnostic task; do not recycle A or B.
