

C2-03 Gate C Protected Review

Logistics Shipments & Service Targets - open only after saved independent model attempt

OBJECTIVE DATA CONTROLS

shipment rows=100 | event rows=233 | hub rows raw=8 | hub unique ids=7 | duplicate hub=H02 | unknown hub=H99 | target rows=21

STRONG ATTEMPT

The learner identifies the duplicated Hub key H02 before creating a one-side relationship, preserves and explains the unknown Hub key H99, keeps facts at their own grains, models higher-grain targets deliberately, chooses date roles from report requirements, and proves filter/total behavior in Power BI Desktop.

CRITICAL FAILURES

Using many-to-many or Both direction merely to bypass a dirty dimension; silently dropping the unknown fact key; joining higher-grain targets to transaction rows; mixed fact grain; wrong/untested date role; ambiguous relationship path; failed material reconciliation; protected review opened before saved attempt.

Gate C competency routing

Repair the failed modeling competency, then prove it on a changed model

COMPETENCY FLOORS

1 Model contract and fact grain. 2 Fact/dimension classification and one-side key quality. 3 Star-schema/conformed-dimension design. 4 Cardinality, active state and cross-filter direction. 5 Legitimate many-to-many/higher-grain handling. 6 Role-playing/date-table design. 7 Power Query source/staging/model-ready architecture. 8 Model QA/reconciliation. 9 Performance evidence where required. 10 Handoff/defense.

PASS PHILOSOPHY

No percentage gaming. One unresolved critical grain/key/cardinality/filter/date/reconciliation failure blocks the Gate even when the PBIX looks professional.

NEXT ROUTE

If instability remains, return to targeted modeling repair with changed evidence; do not recycle Gate A/B.
