

Remediation 1 - Grain / table roles

Use only for the weak modeling competency

WHEN TO USE

Facts/dimensions were chosen by filename or convenience; fact grains are mixed.

TARGETED REPAIR

Take a fresh shipment/events/targets case. Write one-row meaning for every table, classify role, state candidate key and create a star sketch before Desktop.

PASS SIGNAL

Pass when each fact has one consistent grain and each dimension has a valid one-side key.

Remediation 2 - Relationship / M:M

Use only for the weak modeling competency

WHEN TO USE

Duplicate one-side key was ignored, M:M/Both used as a shortcut, or filter path is ambiguous.

TARGETED REPAIR

Use a fresh seller-region bridge case. Separate dirty-duplicate diagnosis from true M:M. Build one tiny propagation visual and record expected vs observed behavior.

PASS SIGNAL

Pass when relationship semantics are justified and filter behavior is predictable.

Remediation 3 - Date roles / calendar

Use only for the weak modeling competency

WHEN TO USE

Multiple fact dates use an unclear active relationship or the calendar is incomplete.

TARGETED REPAIR

Build a continuous Date dimension and decide Created/Closed role strategy from report requirements. Test both roles in Desktop.

PASS SIGNAL

Pass when dates are unique/continuous and every required role has an unambiguous filter route.

Remediation 4 - Model QA

Use only for the weak modeling competency

WHEN TO USE

Only a grand total or successful refresh was checked.

TARGETED REPAIR

Run source rows/totals, dimension key tests, unmatched lists, relationship log, tiny filter tests, date-role test and final measure reconciliation.

PASS SIGNAL

Pass when each failure class has separate evidence and all critical mismatches are explained.

Remediation 5 - Performance

Use only for the weak modeling competency

WHEN TO USE

Optimization changes were guessed or made before result correctness.

TARGETED REPAIR

Restore a known-good model, capture a baseline, inspect unused/high-cardinality fact columns and relationship complexity, make one change, retest identical outputs.

PASS SIGNAL

Pass when result parity is maintained and the performance claim is evidence-based.
