

# C2-04 Advanced DAX & Reporting - Start Here

Begin here before DAX1

## WHY THIS MODULE EXISTS

C2-03 made the semantic model trustworthy. C2-04 teaches how measures behave inside that model, how to debug context, and how to turn validated measures into a usable, accessible, secure and maintainable BI release.

## EXACT ROUTE

DAX1 book -> matching Power BI/practice task -> save genuine attempt -> test detail/total/slicer or UX/security behavior -> explain-back -> protected review -> close review -> changed retry. Repeat through DAX15. Then integrated Mini-Lab -> Gate A. B/C stay protected.

## RUNTIME BOUNDARY

Power BI Desktop is required for DAX/report/RLS behavior. Power BI Service is required to fully execute workspace/app/refresh lifecycle tasks. Environment limitations are recorded honestly rather than converted into mastery.

## C2-04 prerequisite and tools

Advanced concepts are taught from first principles

### YOU SHOULD ALREADY KNOW

Basic Power BI measures/visuals and C2-03 relationship/filter/date-table concepts. You should be able to build a simple SUM measure and a small matrix.

### YOU NEED

Power BI Desktop for core work. Supplied model/data/evidence assets will follow. Service access improves DAX15 execution but is not a hidden prerequisite for understanding the lesson.

### RECOVERY

If a measure feels random, return to DAX1-DAX3 mental models. If a report interaction fails, reduce to one page/visual. If Service access is unavailable, mark environment blocked for the Service-only action and preserve the design/checklist evidence.

## C2-04 mastery / Gate contract

No formula-length prestige and no percentage gaming

### LESSON PASS

Independent measure/report/security/lifecycle task + appropriate runtime evidence + validation/regression checks + explain-back + changed retry. A copied formula or pretty page is not mastery.

### GATE A

Fresh integrated BI release: model context, DAX, report story/interactions, accessibility, RLS and release controls.

### B/C RETEST

Fresh domains/data and changed requirements. Any critical semantic/security/accessibility/reconciliation failure blocks pass regardless of total points.
