

C2-04 Mini-Lab - Executive BI Release

Integrated DAX, report UX, accessibility, RLS and lifecycle practice

SCENARIO

Leadership needs a monthly sales/returns decision pack. The model is already structurally sound. Your job is to create a validated measure family, one executive page, purposeful interactions, accessibility evidence, an RLS design/test, and an operational release checklist.

REQUIRED MEASURE FAMILY

Base Sales; prior-period measure; absolute and percentage change; one rolling metric; contribution % with explicit denominator context; target variance; closing inventory balance as a semi-additive measure. Validate detail, subtotal/grand total, and changed slicer states.

REPORT / SECURITY / RELEASE

Executive page must answer one decision. Add one tooltip, drillthrough and bookmark only when each has a clear purpose. Audit accessibility. Test East, multi-region and unknown-user RLS cases. Define builder/consumer access, refresh owner, and republish-impact check.

Mini-Lab - Mastery defense

Environment blocks are recorded honestly

90-SECOND DEFENSE

Explain: Which filters control your headline measure? Why is the total correct? How is the rolling period defined? What action should leadership take? Which information remains visible without color/hover? Which identities can see which rows? Who owns refresh/failure response?

CHANGED RETRY

After protected review, close it and rebuild the pattern for Support Operations: backlog, SLA, prior/rolling measures, Team detail drillthrough, accessible interaction, Team-based RLS and a service release checklist. Do not reuse the retail page/measure wording.

PASS SIGNAL

Measures reconcile under multiple contexts; report narrative is decision-first; interactions are reversible; accessibility has no critical hover/color-only dependency; RLS is tested; lifecycle ownership is explicit. A Service-only task may be marked ENVIRONMENT BLOCKED rather than falsely passed.
