

C2-05 Gate C Protected Review

Subscription Billing - open only after saved independent Gate attempt

OBJECTIVE FIXTURE CONTROLS

domain=Subscription Billing | approved rows=95 | master rows=15 | unique master keys=14 | duplicate key=A008 | unmatched key=A999 | malformed file=billing_2026_07_MALFORMED.csv

STRONG ATTEMPT

Expected-vs-actual files and malformed-file handling are explicit; duplicate master key is detected before enrichment; unmatched key remains visible; code is modular; technical/data-quality failures are distinguished; log + structured validation exist; critical FAIL withholds output; unchanged rerun is safe; manifest identifies environment, inputs and output.

CRITICAL FAILURES

Uncontrolled file discovery; silent malformed coercion; duplicate-key merge fan-out; unmatched key hidden; blanket exception swallowing; output written before critical checks; rerun appends duplicate business rows; no input/environment manifest; protected review used before attempt.

Gate C competency routing

No percentage gaming

COMPETENCY FLOORS

1 Clean-start script/modularity. 2 Robust pandas/schema/types. 3 Deterministic multi-file scope/lineage. 4 Output/JSON/API reliability as applicable. 5 Defensive errors. 6 Logging + machine-readable validation. 7 Critical release gate. 8 Safe rerun. 9 Reproducibility manifest/environment. 10 Explain-back.

PASS PHILOSOPHY

One unresolved critical file/schema/key/validation/release/rerun/reproducibility failure blocks the Gate even if the rest of the notebook is polished.

NEXT ROUTE

If a critical competency remains weak, return to targeted remediation with new evidence; do not recycle prior Gate solutions.
