

C2-06 Data Warehousing & Platform Foundations - Start Here

Begin here before DWF1

WHY THIS MODULE EXISTS

This is the architecture bridge between advanced analytics and data engineering. You are not being trained as a full Data Engineer here. You are learning what analytical platforms need to preserve grain, history, freshness, lineage and trust.

EXACT ROUTE

DWF lesson -> matching P-DWF workbook sheet -> save architecture/validation evidence -> explain-back -> protected review -> close review -> changed retry. Repeat DWF1-DWF12. Then FleetCare Warehouse Mini-Lab -> Gate A. Gate B/C stay protected.

CLOUD BOUNDARY

No Fabric tenant is required for C2-06 core mastery. Fabric is used as a current implementation example. C2-07 owns deeper cloud/Fabric deployment/identity/workspace/monitoring material.

C2-06 prerequisites and tools

Advanced architecture still begins with simple pictures and vocabulary

YOU SHOULD ALREADY KNOW

Basic SQL/Power BI, row grain, simple fact/dimension ideas and validation. If those are weak, repair only that prerequisite rather than memorizing architecture terms.

YOU NEED

The supplied practice workbook and synthetic data/controls. Diagramming can be done inside workbook/text/paper. A Fabric workspace is optional, not a hidden paid requirement.

RECOVERY

When architecture feels abstract, use one concrete business event: an order, shipment, ticket or appointment. State one row, history need, user question, freshness and failure check. Then introduce platform terms.

C2-06 mastery / Gate contract

No architecture-diagram prestige and no percentage gaming

LESSON PASS

Fresh architecture decision + explicit grain/history/latency/quality evidence + independent validation + explain-back + changed retry. A diagram containing many boxes is not mastery.

GATE A

Fresh integrated warehouse/platform design with history, layers, storage/latency, lineage and quality controls.

B/C RETEST

Different business processes and defects. Any unresolved critical grain/history/FK/reconciliation/release-control failure blocks pass.
