

C2-06 Mini-Lab - FleetCare Analytics Warehouse

Cumulative architecture practice after DWF1-DWF12

SCENARIO

FleetCare currently joins sales, customer and support exports manually for reporting. Leadership wants reliable Sales, Customer Service, Target and historical customer analysis. Your design must separate business processes, preserve required customer history and make quality/failure ownership visible.

REQUIRED DESIGN

Define operational vs analytical boundaries; facts/grains; conformed dimensions; business/surrogate keys; attribute-level SCD policy; Landing/Staging/Core/Presentation; ETL/ELT/replay; Warehouse/Lakehouse/both; latency by process; one end-to-end KPI lineage; at least eight quality controls with severity/owner/release behavior.

PASS SIGNAL

Sales and Support are not mixed into one fact. Region/Segment history is defensible. Monthly targets cannot multiply through order lines. The design has a replay point and a clear release-block policy. A second analyst can explain the architecture without guessing from box names.

FleetCare Mini-Lab - Defense and changed retry

Save the independent workbook before review

90-SECOND DEFENSE

Explain: What does one row mean in every fact? Which key identifies a customer and which identifies a warehouse version? Why does historical Region remain correct? Where do transformations run? Why this store/latency choice? Which quality failures block publication?

CHANGED RETRY

After protected review, close it and redesign the same competency for a different company with Orders, Returns, Customer history, Product history and weekly targets. Change the business process/grains rather than renaming FleetCare tables.

EVIDENCE

Save architecture workbook, fact/grain register, SCD history examples, layer/replay design, store/latency decision, lineage map, quality plan, RELEASE/BLOCK reasoning and explain-back.
