

C2-07 Mini-Lab - NorthStar Enterprise Deployment

Integrated Cloud/Fabric/Power BI operational practice

SCENARIO

NorthStar has a central data-platform workspace and Sales BI DEV/TEST/PROD environments. You must design governed item ownership, builder/consumer access, controlled deployment, refresh connectivity/freshness, governance, monitoring/incident response and an analyst-to-engineer handoff.

REQUIRED EVIDENCE

Tenant/workspace/capacity/item topology; Fabric workload selection; OneLake authoritative-data path; semantic-model/report/app distribution; minimum-permission identities; DEV->TEST->PROD release checklist; gateway/credentials/refresh runbook; governance/access-review matrix; diagnosis of INC001 and INC002; one reproducible engineering handoff.

PASS SIGNAL

No consumer receives build/Admin access by convenience. A failed TEST validation cannot reach PROD. Refresh has connectivity/credential/freshness owners. Incidents identify first broken dependency and downstream revalidation. Live tenant steps may be ENVIRONMENT BLOCKED without blocking deterministic mastery.

NorthStar Mini-Lab - Defense and changed retry

Save the independent workbook before protected review

90-SECOND DEFENSE

Explain: Which workspace owns authoritative data? Why are consumers not Contributors? What prevents an unsafe change reaching PROD? When is a gateway needed? Which control proves the 08:00 report is truly fresh? What is the first broken dependency in each incident? Which role owns the requested upstream schema change?

CHANGED RETRY

After review, close it and redesign for a Finance analytics product using a different consumer group, cloud-only sources and no gateway. Preserve environment separation, least privilege, refresh/freshness controls, monitoring and handoff quality without copying NorthStar role names.

EVIDENCE

Topology, access matrix, release checklist, refresh runbook, governance review, incident reports, handoff template and explain-back.
