

C2-07 Gate A Protected Review

Fleet Maintenance - open only after saved independent attempt

OBJECTIVE FIXTURE CONTROLS

domain=Fleet Maintenance | workspaces=4 | personas=4 | sources=3 | gateway sources=1 | failed release=Maintenance Status logic change | incidents=2

STRONG ATTEMPT

Topology/ownership is clear; Fabric workloads are minimal; builders/consumers/deployment/refresh identities get minimum access; failed TEST/security validation cannot reach PROD; gateway/credentials/freshness have owners; incidents identify business impact and first broken dependency; engineering handoff has expected/observed, item/grain/lineage/action/acceptance.

CRITICAL FAILURES

Admin/Contributor for consumers without need; direct PROD editing; failed release promoted; personal/unowned refresh credential; gateway/source path wrong; security validation ignored; incident has no recovery/downstream validation/prevention; live screenshot substituted for deterministic reasoning.

Gate A competency routing

No percentage gaming

COMPETENCY FLOORS

1 Cloud tenant/workspace/capacity. 2 Identity/least privilege. 3 Fabric workload/OneLake topology. 4 Enterprise Power BI distribution. 5 DEV/TEST/PROD release. 6 Gateway/refresh/freshness. 7 Permissions/governance. 8 Monitoring/incident response. 9 Analyst-engineer handoff. 10 Honest runtime/environment evidence.

PASS PHILOSOPHY

One unresolved critical access, deployment, refresh/freshness, security or incident-ownership failure blocks the Gate even when most architecture decisions are correct.

NEXT ROUTE

Gate B remains protected unless explicitly assigned after targeted repair.
